Fundamentals of Programming

2nd Semester 2011-2012

Array of Characters

STRINGS

Strings

- Array of characters or a pointer to characters
- Terminated by a special character called the null terminator `'\0'`
- Can hold a maximum number of characters equal to `size-1`

Declaring Strings

- Strings are declared as:

```
char var_name[size];
```

```
char name[30];
```

```
/*allocate an array of 30 characters  
in the memory*/
```

Declaring Strings

```
char name[30];  
/*This string can hold up to 29  
characters. The last space is  
reserved for the null terminator  
'\0'*/
```

Initializing Strings

- Strings can be initialized upon declaration

```
char nameKo[10] = "myname";
```

	'm'	'y'	'n'	'a'	'm'	'e'	'\0'			
nameKo	[0]	[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]	[9]

Initializing Strings

- Strings can be initialized upon declaration

char nameMo[] = "yourname";

This creates a 9-element static array of characters, including the null terminator

	'y'	'o'	'u'	'r'	'n'	'a'	'm'	'e'	'\0'
nameMo	[0]	[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]

Initializing Strings

- Strings can be initialized upon declaration

This creates a 9-element static array of characters, including the null terminator

```
char nameMo1[] = { 'y', 'o', 'u', 'r', 'n',  
                  'a', 'm', 'e', '\\0' };
```

	'y'	'o'	'u'	'r'	'n'	'a'	'm'	'e'	'\\0'
nameMo1	[0]	[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]

Initializing Strings

- Strings can be initialized upon declaration

```
char *nameNya = "hisname";
```

This creates a pointer variable that refers to the string "hisname" in the memory

Initializing Strings

- Strings can be initialized upon declaration

```
char *nameNya = "hisname";
```

Notes

- Given the following declarations:

```
char s[20];
```

```
char *sp;
```

```
char s1[] = "hello";
```

Notes

```
s = "hello world";    //not valid since s and s1 =  
"hi world";          //s1 are constant  
                      //pointers
```

```
strcpy (s, "hello world"); //valid  
strcpy (s1, "hi world");   //valid
```

Notes

```
sp = "hello world";    //valid
```

```
sp = s;                //valid
```

```
strcpy (sp, "hello word");
```

//not valid because sp is not a string, it is just //a pointer to a character
